

Tuesday-Thursday 2:00-3:45 pm in ISB 231

Instructor: Joel Primack – office hours: Wed 2:00-3:00 pm or by appointment

Office: ISB 318, phone: 459-2580, email: [joel@physics.ucsc.edu](mailto:joel@physics.ucsc.edu)

Catalog Description: Introduction to the particle physics and cosmology of the very early universe: relativistic cosmology, initial conditions, inflation and grand unified theories, baryosynthesis, nucleosynthesis, gravitational collapse, hypotheses regarding the dark matter and consequences for formation of galaxies and large scale structure. Offered in alternate academic years.

Students will be expected to do several homework assignments, and also a term project to be presented orally at the end of the course. We will not follow any one textbook. I had ordered Scott Dodelson, *Modern Cosmology* (Academic Press, 2003) at Bay Tree Bookstore, but I just found out that they forgot to order it, and they would have charged \$75.95 while you can get it online for less (\$46.03 new at Amazon, for example). Here's a list of other good relevant textbooks:

Bailin and Love, *Cosmology in Gauge Field Theory and String Theory* (Institute of Physics Publishing, 2004)

E. W. Kolb and Michael Turner, *The Early Universe* (Addison Wesley, 1993)

Liddle and Lyth, *Cosmological Inflation and Large-Scale Structure* (Cambridge University Press, 2000)

Mukhanov, *Physical Foundations of Cosmology* (Cambridge University Press, 2005)

Padmanabhan, *Structure Formation in the Universe* (Cambridge University Press, 1993)

Padmanabhan, *Theoretical Astrophysics Vol. III: Galaxies and Cosmology* (Cambridge University Press, 2003)

Peacock, *Cosmological Physics* (Cambridge University Press, 1999)

Peebles, *Principles of Physical Cosmology* (Princeton UP, 1993)

Ryden, *Introduction to Cosmology* (Addison Wesley, 2002)

Schneider, *Extragalactic Astronomy and Cosmology: An Introduction* (Springer, 2006)

Weinberg, *Cosmology* (Oxford UP, 2008)

Lectures and selected readings will be posted at [physics.ucsc.edu/~joel/Phys224](http://physics.ucsc.edu/~joel/Phys224) and general information will be at the webpage for this course <http://physics.ucsc.edu/~joel/Phys224.html>

Topics (more or less in order of discussion in class):

1. History of dark matter
2. Homogeneous (Friedmann-Robertson-Walker) cosmologies, cosmological thermodynamics
3. Big bang nucleosynthesis; the Boltzmann equation; baryon, neutrino, and WIMP abundances; Dark matter candidates particle physics and detection: WIMPs, axions, etc.
4. Structure formation: power spectra and evolution of density inhomogeneities; linear theory; nonlinear approximations: spherical collapse, Zel'dovich approximation
5. Cold dark matter theory and variants vs. data: galaxies, clusters, and large scale structure; Press-Schechter, Extended PS; simulations
6. Dark matter halo structure and substructure; halo shapes; angular momentum issues
7. Galaxy evolution, including hydrodynamics (heating and cooling, star formation, and feedback) and effects of active galactic nuclei; simulations and semi-analytic models vs. observations
8. Probes of inhomogeneities in the universe: Cosmic microwave background (CMB), clustering, lensing
9. Phase transitions in the early universe: walls, strings, and monopoles
10. Inflation and dark energy/"quintessence"
11. Baryogenesis (creating slightly more matter than antimatter)
